CHOICE OF THE GIRPI SYSTEM BEST ADAPTED TO YOUR NEEDS

How to select the GIRPI drainage system best adapted to your requirements?

APPLICATIONS	GIRPI SYSTEMS
Domestic Soil & Waste effluent drainage **with high acoustic requirements**	**FRIAPHON®**
Rainwater drainage	**PVC raingutter systems, FRIAPHON®**
Domestic Soil & Waste effluent drainage **as per NF EN ISO metric standards**	**PVC solvent welded fittings**
Domestic Soil & Waste effluent drainage **with d110 single stack system**	**CHUH**
High temperature Soil & Waste effluent drainage in centralised kitchens, in laundries, for sterilisation units, for boiler condensates	**HTA®-E**
Domestic Soil & Waste effluent drainage **for marine / shipbuilding applications**	**HTA®-E**

Certifications

	FRIAPHON®	PVC Evacuation	CHUH	HTA®-E
				
Certifications	ATEC n° 14/14-1948	NF - E	ATEC n° 14/11-1669	ATEC n° 14/13-1885

Welding polymer	GIRFIX **	GIRFIX	GIRFIX	RERFIX
Lubricant	SLUB		SLUB	

* For diameters d78 to d160

** Solvent welding possible for rainwater application

GENERAL PROPERTIES OF FRIAPHON®
Benefits

THE ASSETS OF **FRIAPHON®**:

■ ACOUSTIC PERFORMANCES

FRIAPHON® is designed to meet the highest acoustic performance requirements for drainage piping systems (e.g. French ESA "Exemples de Solutions Acoustiques" scheme). FRIAPHON® is designed to reduce **both airborne** and **structural noises**.

FRIAPHON® limits the noise emissions of domestic equipment in both vertical and horizontal piping sections.

FRIAPHON® has its dedicated range of PHONOKLIP® supporting brackets in order to reduce the transmission of vibrations **from the piping networks towards the walls, i.e. structural noises.**

FRIAPHON®'s acoustic performances were tested by CSTB (France) and Fraunhofer Institut (Germany) according to EN 14366 standard. **FRIAPHON® meets the highest regulatory requirements, such as the ESA5 acoustic performance rating.**

■ PERFORMANCES ON BUILDING SITES

As a complete system consisting of FRIAPHON® pipes and fittings combined with PHONOKLIP® brackets, it fits in all building site configurations (connections with other piping materials also possible).

Lightweight and easy to handle: FRIAPHON®'s light weight makes it very easy to handle on site.

Simple tools, no fire permit required: the installation of FRIAPHON® does not require the use of complex tools, and does not require the possession of a fire permit, which makes it an ideal system to **install in occupied buildings.**

Safe joining conditions: FRIAPHON® pipes and fittings all respect the same standard size tolerances.

■ DURABILITY AND SUSTAINABILITY

No corrosion, reduced scaling.

FRIAPHON® pipes and fittings are submitted to quality controls carried out by an independent laboratory (CSTB in France) and **are certified under ATEC 14/14-1948**.

FRIAPHON®'s **fire reaction properties are Bs1d0** rated according to Euroclasses. Its material and design also enabled it to obtain the **NF-Me** certification (from d78 to d160). Those performances enable FRIAPHON® to comply with the fire regulations that apply to buildings receiving the public.

GENERAL PROPERTIES OF FRIAPHON®
Benefits

THE ASSETS OF **FRIAPHON®** :

■ ENVIRONMENTAL PERFORMANCES

FRIAPHON® is the first acoustic drainage system that contains no heavy metals. Stabilised with organic calcium, its environmental footprint is distinctively low.

FRIAPHON®'s environmental properties are described in its **"FDES"** Environmental and Sanitary Data Sheet, validated by an independent laboratory (CSTB, France) according to EN 15804 standard.

FRIAPHON®'s basic raw material is PVC, which is entirely recyclable.

FRIAPHON® meets the requirements of environmental schemes such as HQE (France), BREEAM (UK), LEED (USA), "GBC" Green Building Council (worldwide), BASTA (Sweden), SWAN (Denmark). GIRPI is a founding member of the Green Building Council's French branch.

■ SUPPORT TEAM PERFORMANCE

GIRPI's Technical Support team can help you carry out detailed execution drawings: network drawings with fitting article references, bills of quantities, bracket positioning, BIM 3D library compatible with REVIT software.

GIRPI's hotline can help you answer questions on the spot, and carry out your building site interventions in the best possible conditions.

GIRPI's on-site technical assistance can help you train building site operatives to install GIRPI piping systems.

GIRPI's web site enables you to consult and download its commercial or technical literature, certificates, and approvals.

GENERAL PROPERTIES OF FRIAPHON®
Characteristics

The physical characteristics below are measured on standard probes before aging.

PHYSICAL CHARACTERISTICS

Characteristics	Performances
Fire Reaction Rating	Bs1d0 Euroclasses according to NF EN 13501 all across the range NF Me from d78 to d160
Volumetric mass	Pipes: 1600 kg/m3 +/- 100 kg/m^3 Fittings: 1400 kg/m3 +/- 100 kg/m^3
Material	Pipes: - internal layer: PVC-U in beige colour - external layer: PVC-U modified for improved acoustic performances in RAL 7024 grey Fittings: PVC-U in RAL 7024 grey Gaskets: EPDM hardness 50 Shore A according to EN 681-1 standard
Durability	Equivalent to that of compact PVC-U pipes covered by NF-T 54030 and EN 1329-1 standards
Vicat	Pipes: - internal layer: 79°C or above - external layer: 79°C or above Fittings: 79°C or above
Creep at 150°C	5 % maximum
Expansion cœfficient	0.08 mm/m/°C
Pressure resistance	With push-fit fittings: 0.5 bar With cemented fittings: 3 bar

■ CHEMICAL RESISTANCE

Water or any other fluid containing a suspension or solution of chemical agents other than (or in other quantities than) those admitted in standards and regulations concerning potable water are to be considered as chemicals. Therefore, their compatibility with FRIAPHON® must be checked.

Whenever particular conditions justify the use of acoustic or thermal insulation on the piping networks, the compatibility of the insulation material, its adhesive and FRIAPHON® must be checked.

If in doubt, consult both supplier and GIRPI's technical support: be.girpi@aliaxis.com

■ PRODUCT QUALITY

In order to ensure a consistent quality level for its productions and to guarantee its users performances matching those declared, GIRPI implements a set of control rules described in its ATEC approval, delivered by CSTB.

Those controls cover the physical and mechanical characteristics of its pipes and fittings.

Those controls play an essential role, as the acoustic performances of a piping system can be greatly altered if the characteristics of the pipes and fittings are not kept within the standard tolerances.

Controls are carried out upon receipt of each component, of the raw material (Vicat, density), and on finished products (impact resistance, reaction to heat, dimensional controls).

In the framework of its CSTBat quality mark, the characteristics and performances of randomly collected FRIAPHON® samples are regularly controlled by an external certification body.

Industrial and logistic processes are ISO 9001 approved. This enables our customers to be assured of our products' technical performances and of our services' quality (production, deliveries, technical support).

GENERAL PROPERTIES OF FRIAPHON®
Operating conditions

■ FIELDS OF APPLICATION

FRIAPHON® is exclusively designed for the gravity drainage of: domestic soil and waste effluents, rainwater from buildings and their attachments.
FRIAPHON® must be used and installed in compliance with the standards, guidelines and building regulations which respectively apply in each country. In France, those are:

- **DTU 60.32**: *PVC-U piping systems, rainwater drainage*.
- **DTU 60.33**: *PVC-U piping systems, soil and waste effluent drainage.*
- **DTU 60.1 P1**: *drainage piping networks.*

FRIAPHON® is not designed for:

- underground sewerage networks outside buildings,
- drainage systems for laundry and industrial kitchen effluents,
- drainage systems for chemical cleaning effluents,
- vacuum systems in dental surgery practices,
- drainage systems for effluents having a high content of benzene.

■ GUARANTEES

GIRPI guarantees its products for a duration of 10 years from the delivery to the first purchaser, except for normal wear parts. This guarantee applies only when the products are chosen, stored, installed and used in strict compliance with the technical documentation, the applicable certificates and codes of practice, and covers only the replacement of defective parts, excluding any other damage.

No application other than those exactly expressed in the technical documentation can be guaranteed, particularly concerning:

- the nature and the type of installation for which the products are being used,
- supporting methods, and materials,
- insulation methods, and materials,
- installation and working conditions (flushing, etc.),
- the nature of the fluids to be transported, and the working temperature-pressure values to be respected.

It is reminded that GIRPI does not take responsibility for the hydraulic design of piping networks, namely as far as pipe dimensioning is concerned.

■ ACOUSTIC PERFORMANCES

The **acoustic test results** shown in this technical documentation **result from tests** carried out in various specialised laboratories according to the requirements of EN 14366 standard, **or from simulations** carried out using the ACOUBAT software (according to EN 12354 standard).
Those tests and simulations give objective values according to accurately defined conditions (network and building configurations, flow rates, construction design, room dimensions, etc.) and **cannot be compared to the acoustic performances of a building measured on site**. Indeed, many factors which are independent from the product's intrinsic performances can influence measurements made on site (installation, construction environment, configurations, etc...).
Relevant test reports can be made available upon simple request from: be.girpi@aliaxis.com or +33 (0)2 32 79 58 00

GENERAL PROPERTIES OF FRIAPHON®
Acoustic regulations in buildings

In order to limit the exposure of persons to noises and the nuisances or inconveniences which result from them, regulations define the maximum acceptable noise levels in various buildings.

LEVEL OF ACOUSTIC PRESSURE	HOUSING (NEW)	TEACHING FACILITIES	HEALTH CARE FACILITIES	HOTELS
	NRA: New Acoustic Regulations (1999)	Legislation of 25 April 2003 relating to noise limits	Legislation of 25 April 2003 relating to noise limits	Legislation of 25 April 2003 relating to noise limits
30 dB(A)	Main rooms (living room and bedrooms)		Bedrooms	Bedrooms
33 dB(A)		Libraries, infirmaries, rest rooms, music rooms		
35 dB(A)	Other (kitchens, bathrooms)		Examination rooms, offices, waiting rooms	
38 dB(A)		Class rooms, administration, meeting rooms		
40 dB(A)			Health care rooms, operating theatres, workshops	

■ RESIDENTIAL BUILDINGS

In France, the Act dated 30th June 1999 covers acoustic characteristics of residential buildings.
That Act is also known as **"NRA" New Acoustic Regulation**, and concerns professionals investing in, selling or developing buildings.
It applies to all residential buildings without exception.
It sets maximum acceptable noise levels according to the final use of the buildings (see table above).

In France, the Act dated 27th November 2012 covers the proof of compliance with acoustic regulations.
It applies to all actors in the building industry.
It applies to **all residential buildings** whose application for construction has been placed as **from 1st January 2013.**
It makes the production of a document proving that acoustic requirements are complied with compulsory for the investor or his representative, together with the declaration of the building works' completion.
Those documents must show the means and solutions implemented in terms of acoustic treatment, from the initial study stage until project completion.
For projects of more than 10 dwellings, control measurements must be carried out after completion of the building work, and those results must be attached to the declaration documents.

■ OTHER BUILDINGS

In France, the Acts dated 25th April 2003 cover noise limitation.
Those Acts apply to all building investors or their representatives.
They apply to **all buildings used for education, health care and hospitality.**
They define maximum acceptable noise levels according to the final use of the buildings (see table above).

GENERAL PROPERTIES OF FRIAPHON®
Acoustic regulations in buildings

Those regulations are completed by various guidelines and recommendations. Their aim is to accompany professionals working on the design and execution building projects at each stage. Some examples are given below.

■ TECHNICAL GUIDE ON THE IMPLEMENTATION OF ACOUSTICS IN NEW BUILT RESIDENTIAL PROJECTS

(December 2015) by CSTB, France (Scientific and Technical Building Centre).

This guide is intended for consulting engineers and control engineers, and studies various cases of systems and designs which can impact the acoustic performances of a building.
For each case, it gives a critical review of the reference standards and documents covering their implementation, as well as a chronology to identify watch points at each stage of its execution, followed by examples of good practice.

■ CIRCULAR INFORMATION LETTER DATED 25TH APRIL 2003, ABOUT THE APPLICATION OF ACOUSTIC REGULATIONS IN NON RESIDENTIAL BUILDINGS

French Department of Equipment, Transports, Accommodation, Tourism and Sea.
French Department of Environment and Sustainable Development.
French Department of Health, Family and Handicap.

This circular letter is intended for public and private investors and developers. It brings extra clarification to interpret the Acts dated 25th April 2003, especially on the following subjects:

- definition and calculation of the evaluation indexes used in the Acts;
- how to carry out measurements and assess the results obtained when the acoustic quality of a building is being reviewed;
- common requirements to all buildings;
- specific requirements per type of building.

It also reminds the obligation for public and private investors and developers to clearly mention the Act that they are bound to respect in their project's specifications.

■ RECOMMENDATION GUIDE ABOUT UNDERSTANDING AND MANAGING ACOUSTIC PERFORMANCE DECLARATIONS

(January 2014) by the French Department of Territorial Equality, Environment, Sustainable Development and Energy.

This guide, essentially intended for public and private investors and developers:

- aims at facilitating the implementation of applicable regulations,
- does not have any regulatory status in itself,
- brings extra clarification on the contents of the acoustic performance declaration,
- reminds the requirements to be met when monitoring acoustic quality,
- proposes monitoring report sheet models for each stage.

GENERAL PROPERTIES OF FRIAPHON®
Acoustic regulations in buildings

■ "ESA" EXAMPLES OF ACOUSTIC SOLUTIONS - THE 2000 ACOUSTIC REGULATIONS

(January 2014) by the French Department of Environment, Sustainable Development and Energy.

This document aims at providing guidance at design stage, and has no regulatory value.

It consists of two sections.

The **first** section introduces **various solution examples** classified to mirror the contents of the regulation, such as "Noises generated by Equipment: downpipes and technical shafts for drainage purposes".

The **second** section introduces **products or systems** that can be used in order to meet the regulation's requirements.

The acoustic performances of various products are evaluated and **classified on a scale ranging** from **ESA1** to **ESA6** (from lowest to highest performance levels). The scale was designed so that the **ESA4** rating can be considered as sufficient to ensure compliance with those minimum regulatory requirements.

The ESA acoustic performance scale

Together with the technical shafts in which they are installed, soil, waste and rain water drainage piping networks belong to the group of collective building equipment whose **acoustic performance will affect the building's overall performance.**

As such, they require **specific attention** from the teams working on a building project at all stages: design, materials selection and implementation, execution of the project.

The **"ESA"** document, published by the French government's Department in charge of accommodation and sustainable development, introduces piping solutions and technical shaft materials which are classified according to their isolated and combined **acoustic performances** with a view to meeting or exceeding the minimum regulatory requirements.

It is one of the recognised **reference documents** available to date, and its use is recommended to help the teams working on a building project at design stage, in order to select the most appropriate materials.

That document can be downloaded from the web site of the French Department of Environment, Sustainable Development and Energy.

The solutions shown in that guide were evaluated by using the "ACOUBAT" (short for building acoustics) calculation software, which was designed according to the requirements of EN 12534 standard. Worst case conditions were entered for each calculation and each solution's performance was classified and given an **"ESA"** rating.

GENERAL PROPERTIES OF FRIAPHON®
Acoustic regulations in buildings

NOISES GENERATED BY EQUIPMENT: DOWNPIPES AND TECHNICAL SHAFTS FOR DRAINAGE PURPOSES

Concerning effluent drainage piping networks for soil, waste and rain water, the applicable “ESA” performance scales are **ESA3, ESA4** and **ESA5.**

RECOMMENDATIONS

RECOMMENDATIONS	STRUCTURAL NOISE ACCORDING TO EN14366	AIRBORNE NOISE ACCORDING TO EN14366	EXAMPLES OF ESA ACOUSTIC SOLUTIONS
ESA 3	25/33 dB(A)**	53<Lna<57	Pipes and fittings in NF certified PVC-U
ESA 4	25/33 dB(A)**	49<Lna<53	Pipes and fittings with certified acoustic characteristics
ESA 5	25/33 dB(A)**	Lna<49	NF certified cast iron and FRIAPHON® piping systems

***: 33 dB with standard brackets, 25 dB with acoustic brackets*

RESULTS

RESULTS	STRUCTURAL NOISE ACCORDING TO EN14366	AIRBORNE NOISE ACCORDING TO EN14366	SOFFIT ACCORDING TO EN14366	CHANGE OF DIRECTION
PVC	25 dB(A) or 33 dB(A)	57 dB(A)	61 dB(A)	63 dB(A)
FRIAPHON®	11 dB(A)	48,5 dB(A)	50 dB(A)	58 (54*) dB(A)

**: By adding heavy gauge phonic insulation (4 to 8 kg/m²)*

TEST RESULTS

In order to obtain objective acoustic performance results and help designers in their choice of solutions, several measurement tests were carried out in the laboratories of CSTB, France, and Fraunhofer Institut, Germany.

The tests covering straight downpipes and soffit configurations were carried out according to EN 14366 standard: laboratory measurements of noises generated by effluent drainage piping networks.

The tests measuring noises generated by downpipes incorporating changes in direction were carried out according to a document called “FIC no. 2014/AI02” established by CERQUAL, France (Quality Certification institute). That document is an Interpretation Sheet Completing the “Qualitel” (Quality Evaluation) and “Habitat & Environnement” (Environmentally Sustainable Residences) schemes.

The test results shown in the tables above result from measurements made as illustrated:

Point A : airborne noise
Point B : structure borne noise behind a partition wall
Point C : noise in the soffit area

ESA 5

FRIAPHON® obtains the best ESA 5 rating.

In the **ESA** framework, FRIAPHON® allows for the use of low acoustic performance materials for technical shafts. The use of high acoustic performance shafts with FRIAPHON® makes it possible to obtain **acoustic comfort**.

GENERAL PROPERTIES OF FRIAPHON®
Acoustic performances

TECHNICAL SHAFTS FOR WATER EFFLUENT DRAINAGE PIPINGS

The acoustic performances of technical shafts called ΔL_{an} is expressed in dB(A). It is obtained by measuring the drop in airborne noise resulting from the insertion of a given material to serve as a technical shaft. The measurements are carried out according to EN 14366.

Concerning technical shafts for soil, waste and rain water piping systems, the applicable "ESA" performance scales are **ESA2, ESA3, ESA4** and **ESA5**.

MATERIAL CHARACTERISTICS:

RATING	CERTIFICATION	TYPE APPROVAL TESTS LESS THAN 10 YEARS OLD	DESCRIPTION
ESA 2	-	$19 \leq \Delta L_{an} < 24$	50 mm thick cellular partition 50 mm thick cellular partition + 1 standard quality BA13 plasterboard plate
ESA 3	-	$24 \leq \Delta L_{an} < 29$	72/48 partition wall + 1 standard quality BA13 plasterboard plate on each side of the metallic structure Masonry partition wall, 50 mm brick or plasterboard plates Sandwich panels of 70 mm thickness Counterplate on metal structure with 2 standard quality BA18 plasterboard plates (both fixed to the same side of the structure) without any mineral wool
ESA 4	-	$29 \leq \Delta L_{an} < 34$	Masonry partition wall, 50mm brick or plasterboard plates, 50mm mineral wool inside the shaft Masonry partition wall, 100mm brick or plasterboard plates Sandwich panels of 73mm minimum thickness 72/48 partition wall + 1 acoustic quality BA13 plasterboard plate on each side of the metallic structure Counterplate on metal structure with 45mm thick mineral wool + 2 standard quality BA13 plasterboard plates (both fixed to the same side of the structure)
ESA 5	-	$34 \leq \Delta L_{an}$	Sandwich panels of 70mm thickness + 2 standard quality BA13 plasterboard plates 72/48 partition wall + 1 standard quality BA13 plasterboard plate on each side of the metallic structure + 40 mm mineral wool inside the shaft Sandwich panels of 73 mm minimum thickness + 80 mm mineral wool inside the shaft 50mm thick cellular partition + 30 mm mineral wool inside the shaft + 50 mm thick cellular partition

Source: "ESA" Examples of Acoustic Solutions guide.

NOTES:

The notion of "type approval" implies that the acoustic tests have been carried out by an accredited laboratory, (e.g. recognised by COFRAC in France), according to the standards which applied at the time.

Inspection traps usually are at least as acoustically efficient as shaft components. That generally implies the use of gaskets on all 4 sides of the trap, and their compression when the trap is in closed position.

Source: "ESA" Examples of Acoustic Solutions guide, Technical Sheet 2.7 (p.11)

Configurations ① ② ③ are shown on Technical Sheet 2.12 (p.16)

Depending on the configurations, the use of FRIAPHON®, thanks to its **ESA 5** rating, allows for the use of technical shafts with a lower acoustic attenuation level than if standard NF Me PVC drainage or other **ESA 4** rated piping systems are being used.

The selected shaft materials can be 1 to 2 rating levels lower in most cases.

In order to help the teams in charge of designing buildings, GIRPI has carried out various calculations of simulated cases by using the ACOUBAT software, and has asked CSTB to carry out various measurements of the configurations studied in the **"ESA"** guide.

3 - Test completed at Aliaxis RD

The result of 54 dB was obtained with an isolation kit composed of ST thermal elastomer insulation and heavy gauge phonic insulation 4 to 8 kg/m

Meeting acoustic regulations does not guarantee acoustic comfort

Expert advice:

Mr. Thierry Mignot, legal expert and member of the CNB, France (National Noise Council), explains:

- "Legal complaints resulting from noise problems most often reveal that the allegations made by the plaintiffs suffering from acoustic **disorders concern buildings which comply with the current acoustic regulations, thus revealing a gap between the level of expectations and reality when it comes to acoustic comfort**. Due to a general lack of information, people are convinced that a building which complies with acoustic regulations guarantees acoustic comfort to its occupants. In fact, the regulation only aims at avoiding worst case situations such as the sheer impossibility to live in a really noisy building. As a result, the plaintiffs can get very frustrated when they are faced with reality".

- **"The current regulations only set infraction noise thresholds"**.

- "Furthermore, one could think that the succession of regulations should have resulted in an improved protection from noises. Unfortunately, that is not the case. For instance, the maximum accepted noise levels generated by domestic equipment had been set at 30 dB(A) in the 1960s, considering that ambient noise in collective dwellings (neighbours, street) was at a similar level, resulting in no perceived acoustic aggravation for the occupants. However, it has been observed that the general improvement of a building's thermal insulation resulted in the installation of better sound insulating windows, which in turn resulted in ambient noises in collective dwellings dropping to approximately 20 dB(A). The above implies that a piece of domestic equipment which meets the regulatory noise levels of 30 dB(A) has now become much more noticeable than it was 50 years ago**".**

Source: "l'état de l'environnement sonore" (evaluation of the sound environment), by CIDB, France – 2014"

GENERAL PROPERTIES OF FRIAPHON®
Acoustic performances

In order to help persons in charge of designing buildings, GIRPI calculated the performances of various combinations of materials by simulation.

Those calculations were based upon test results coming from CSTB, France, for each of the configurations proposed in the "ESA" guide of acoustic solution examples, using the "ACOUBAT" calculation software according to the requirements of EN 12534, in worst case scenario configurations (25 m³ room of the following dimensions: L = 2.5m x W = 4m x H = 2.5m).

Drainage piping systems only constitute part of the materials and systems used in a building which will contribute to its global acoustic performance. As such, a piping system alone is not able to ensure the global acoustic performance of a building. The quality of implementation / installation of all systems plays a decisive role in that field (for more details, please refer to sheets 2.6 and 2.7, p.10&11 of this document).

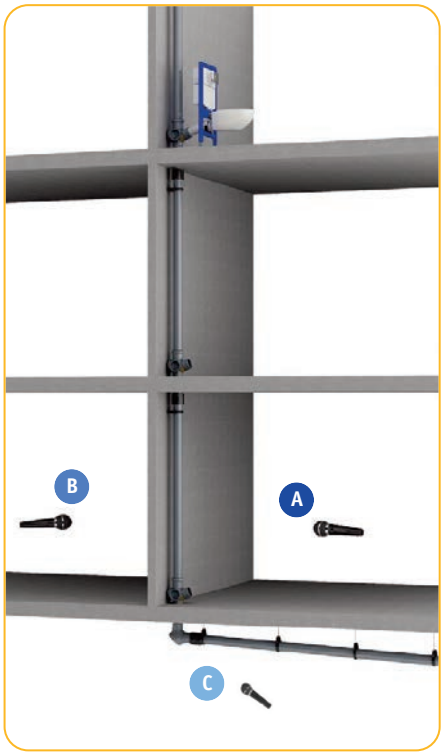
OPPORTUNITIES WITH FRIAPHON®
Acoustic performances

■ TEST RESULTS

Point A : airborne noise on downpipe
Point B : structural noise behind partition wall
Point C : airborne noise 1 x 90° deflection in soffit



■ ACOUSTIC PERFORMANCES OF FRIAPHON®

✓ Concerning structural noises (point B), FRIAPHON® combined with PHONOKLIP® brackets makes it possible to limit noise emissions on the other side of a partition wall (facing the wall, 2 floors below the source of noise) to levels which cannot be perceived by the human ear.

Thanks to its complete system, it also makes it possible to reach low acoustic emissions in less frequent, but sensitive cases such as 1 x 90° deflections in soffit, and 2 x 45° deflections in the downpipe.*

✓ In a 25m³ room which is crossed by a non-insulated downpipe, FRIAPHON® makes it possible to reduce noise emissions by 7 dB(A) to 12 dB(A) as compared to NF-Me standard PVC. *

✓ To meet the regulatory requirement of 30 dB(A), FRIAPHON® only requires the use of **ESA2** rated shafts for straight downpipes or 1x90° deflections in soffit, and **ESA3** rated shafts for 2 x 45° deflections in the downpipe.*

* see technical sheets 2.12 (p.16) and 2.13 (p.17)

QUALITY CERTIFICATIONS
Quality labels for buildings

The certification of a building project is based on voluntary decisions from the developers.
The acoustic performance levels are set by the authorities managing the certification or label in their specifications.

■ CERTIFICATION OF BUILDING PROJECTS INTEGRATRING ACOUSTIC PERFORMANCES:

These are examples of current certifications and labels in France:

Non-residential buildings ⇨ **NF HQE** certification or **HQE compliant** design

Residential buildings ⇨ **QUALITEL** label - **CERQUAL** “Environmental Dwelling” label - **NF HQE** certification

NF HQE certification / HQE scheme / Acoustic Comfort

The HQE scheme, supported by the HQE society (chartered society acting for general public interest), aims at improving the environmental quality of buildings under construction, under renovation, or in use.

The design of a building project meeting the requirements of that scheme is based on voluntary decisions from the developers. The operation can also result in a NF HQE certification by independent organisations (CEQUAMI, CERQUAL, CERTIVEA).

The HQE environmental quality management method applies at all stages of a building project, from initial design to final execution, and aims at delivering a building that is durable, healthy and comfortable to live in.

It revolves around 4 environmental commitments (construction, management, health and comfort), split into 14 targets. Target no.9 relates to **acoustic comfort**.

In order to obtain a “high performance” rating for that target, 90% of the building must be designed so as to obtain acoustic performances at least 3 dB(A) lower than regulatory requirements.

QUALITEL / Environmentally Sustainable Residences

Those certifications apply to individual and collective residential buildings. Approximately 30% of new built dwellings currently obtain those certifications.

Those certifications aim at guaranteeing that the building projects have been carried out in order to meet regulatory requirements, and designed with a view to exceeding those requirements.

In order to obtain a certification of acoustic performances, a building project must meet or exceed the acoustic regulatory requirements applicable to each room, according to its intended use.

The specification is completed by documents called “FIC ” Interpretation Sheets Completing the “Qualitel” (Quality Evaluation) and “Habitat & Environnement” (Environmentally Sustainable Residences) schemes. Those sheets explain some possible configurations and solutions that can help meet the specifications of those schemes.

FRIAPHON® INNOVATIONS
Acoustic cushioning elbow

■ ACOUSTIC CUSHIONING ELBOW

When drainage piping networks change direction (e.g. from vertical to horizontal), **they create a sensitive acoustic area**. The flow **of the effluents gets disturbed, which generates impacts, wash and turbulence areas.**

This requires particular attention, as horizontal collection piping sections are often installed in ceiling soffits, and run in areas of the building where living rooms, shops, offices and meeting rooms can be located. The most common way to address this potential source of nuisance consists in using large radius bends or combinations of 45° elbows**.**

GIRPI innovation

GIRPI introduces an acoustic cushioning elbow to absorb impacts and vibrations where the vertical downpipe ends, and reduce noise emissions.

Cross-sectional view

Detail of access plug

Its design enables it to obtain exceptional acoustic performances:

- 87°30 elbow with a curvature radius equivalent to that of two 45° elbows.
- Elastomer membrane to absorb impacts and vibrations.
- Gasket push-fit socket connection to reduce the transmission of vibrations between pipes and fittings.

■ SOFFIT AND STRAIGHT DOWNPIPE TEST RESULTS ACCORDING TO EN 14366 STANDARD

54 PVC NF-E NF-Me

61 PVC NF-E NF-Me

Values expressed in dB(A)

FRIAPHON® INNOVATIONS
Acoustic damper patch

■ ACOUSTIC DAMPER PATCH

GIRPI has carried out studies on the acoustics of domestic effluent drainage.

Those studies show that branches and the bottoms of downpipes generate vibrations which expand towards the nearest piping sections, resulting in increased noise emissions.

A local increase of the piping section's surface mass results in a significant reduction of those phenomena.

GIRPI innovation

GIRPI introduces an acoustic damper patch made from heavy surface mass materials, whose function is to locally increase the downpipe's surface mass, resulting in a reduction of noise emissions by 15%.

The patch consists of high surface mass insulation material encapsulated in an articulated plastic body, easily fixed around pipes by means of two captive sets of screws and retention springs.

For optimal results, we recommend the installation of the acoustic patch:

- below each branch along downpipe stacks,
- immediately after the change of direction located at the bottom of each stack.

FRIAPHON®

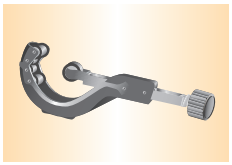
The most efficient acoustic drainage piping system for soil, waste and rain water effluents.

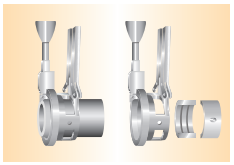
FRIAPHON® INSTALLATION
Tools

■ HANDLING AND STORAGE

The pipes and fittings will be stored separately on an even area, away from dust and sun. In all cases, take special care to avoid rough handling, impacts with indenting, cutting or heavy objects, particularly in cold weather.

■ CUTTING





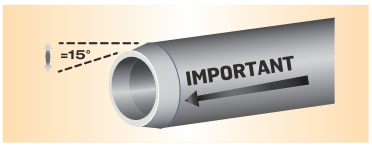
• **The roller plastic pipe-cutter**
Allows for neat, clean cuts to be carried out.

GIRPI Ref. **CT50125R** for diameters 52 to 110 mm

GIRPI Ref. **CT110160R** for diameters 110 to 160 mm

The use of disk saws is tolerated if the blades used are adapted to PVC material and if the pipe is guaranteed to be cut square.

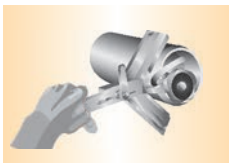
■ TRIMMING - CHAMFERING

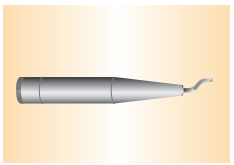


After cutting, the pipe must be trimmed inside and a chamfer must be made on the outside**.**
These operatons can be performed by means of the following tools:

• **Chamfering tool**
This tool chamfers the pipe outside from Ø 52 to Ø 160.

GIRPI Ref. **CHANF160R**





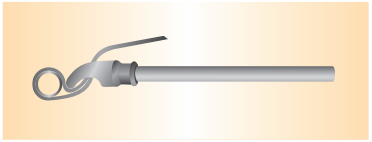
• **The use of tools including cutting or abrading disks to chamfer pipes is strictly prohibited.**

• **Trimmer**
This reams the inside of pipes of all diameters.

GIRPI Ref. **EBAV1R** Ø 20 to 160 mm

■ HOLDING TOOLS

• **Chain vice**
Polyurethane pipe-rests hold the pipe without any scratching.



• **Strap wrench**
Maximum gripping power, with no risk of deforming the pipes or fittings (braided nylon strap).

• **Bench vice**
When using such traditional vices, it is mandatory to clamp the pipes by means of wooden notched pipe-rests.

FRIAPHON® INSTALLATION
Joining method

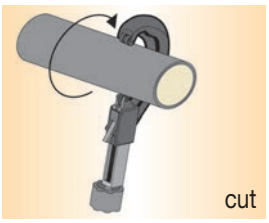
■ CHECKS PRIOR TO JOINING

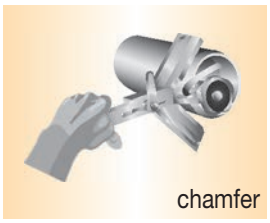
Regardless of the joining method (solvent welding or push fit with gaskets):

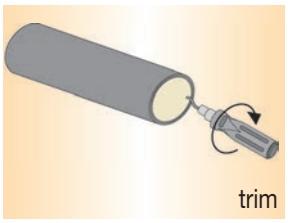
- Make sure that pipes and fittings are clean and dry before joining.
- Make sure that pipe ends are chamfered.
- Make sure that pipes and fittings are free from any traces of impact, deep scratches, etc....

As a general rule, GIRPI recommends the push fit joining method, using FRIAPHON® fittings with gaskets. Solvent welded joints should be reserved for special cases such as: non accessible piping sections, pressure build ups above 0.5bar, etc....

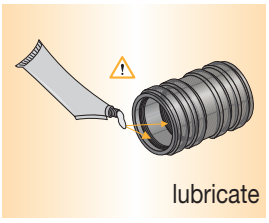
■ PREPARATION OF THE PIPES

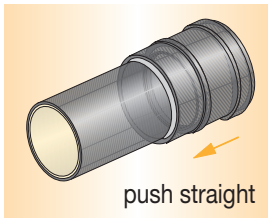


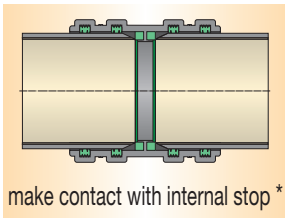




■ PUSH FIT JOINING







* marking socket depths on pipes helps ensuring that the fitting has been pushed home.

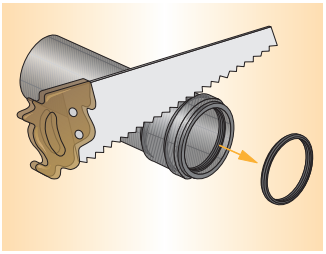
⚠ The use of inappropriate lubricants can severely damage or disintegrate the gaskets.

- Spread the FRIAPHON® dedicated SLUB lubricant, preferably using a brush, on all gaskets and on the chamfered end of the pipe.
- Push pipe straight into the fitting until making contact with the fitting's internal stop.

■ CONVERSION OF FITTINGS

Push-fit fittings with gaskets can be converted for solvent cementing as follows:

- Remove gaskets.
- Saw the fitting's grooved end off.
- Check remaining socket depth for the solvent welding operation.



⚠ Never use fittings with their gaskets to carry out solvent welding operations.

FRIAPHON® INSTALLATION
Joining method

■ SOLVENT WELDING

- Pipes and fittings MUST be clean and free from any trace of humidity.
- Make sure that the cement is fluid and homogeneous.
- The cement's colour may vary depending on ambient temperature and humidity, but that will not affect its performances.
- Check the cement's use-by date on the pot.

⚠ The acoustic performances of solvent welded connections are less good than those of push fit connections made with fittings equipped with rubber gaskets.

priming

apply cement

push straight

1 - The cement shall be applied using the cement pot's own brush.
2 - The use of any other method is prohibited, namely : fingers, woodsticks or any other ustensil.
3 - Apply the cement over the whole female (socket) depth first, and afterwards over the whole, corresponding length of the male end (pipe or spigot).
4 - Push straight until reaching the socket's internal stop.
5 - Keep held together for a few seconds.
6 - Remove excess cement.
7 - On large sizes, starting from diameter 110mm, **2 fitters must operate simultaneously** (i.e. one fitter will apply cement to the male end while the other fitter will be applying cement to the female end, and both fitters will then join both ends together).
8 - Respect the drying times indicated on the pot before using the piping installation.

⚠ Expansion movements must be taken into account and compensated by appropriate means.

■ PARTICULAR RECOMMENDATIONS

⚠ PARTICULAR CLIMATIC CONDITIONS

- Temperature range required for cold welding: +5°C to +35°C.
  If the welding polymer is stored at 20°C, welding is possible at 0°C.

The atmospheric conditions (temperature, humidity) considerably affect the curing/drying time, (evaporation of solvents of the welding polymer). Therefore:

- At low temperature, the parts when assembled should be held together for 20 to 30 seconds.
- In hot weather, the adhesive should be applied rapidly and the parts immediately joined. So as to avoid evaporation of the welding polymer, the pot must be closed after each welding operation, and it must be used as quickly as possible once opened, especially under warm climatic conditions.

■ THERMOFORMING

Thermoforming of FRIAPHON® pipes is strictly prohibited and involves the cancellation of GIRPI's manufacturer's guarantee. For all direction changes, exclusively use FRIAPHON® fittings.

When faced with particular problems, ask GIRPI for an offer for special fabricated fittings by contacting GIRPI's Technical Support team at: be.girpi@aliaxis.com or +33 (0)2 32 79 58 00

■ SOURCES OF HEAT AND UV

FRIAPHON® should in no case be installed close to a source of heat causing a rise in temperature greater than its limits of use, and must be protected from exposure to ultraviolet rays.

■ EXPANSION

The expansion coefficient of FRIAPHON® pipes is 0.08 mm.m/°C. Therefore, their expansion movements need to be taken into account all along the networks installed.

For instance, in France, DTU 60.33 code of practice makes the use of an expansion compensation device compulsory at each floor level on vertical piping sections, and between each anchor point on horizontal piping sections.

Thanks to the specific design of its SMA double sockets which enables them to fulfil both functions of expansion compensation and acoustic disconnection, and thanks to adapted supporting brackets (e.g. PHONOKLIP®), the FRIAPHON® system meets the requirements of DTU 60.33 code of practice without the addition of any extra specific device.

FRIAPHON® INSTALLATION
Supporting PHONOKLIP® brackets

■ PHONOKLIP® SUPPORTING BRACKETS

A drainage piping system must include:

- anchors,
- guides.

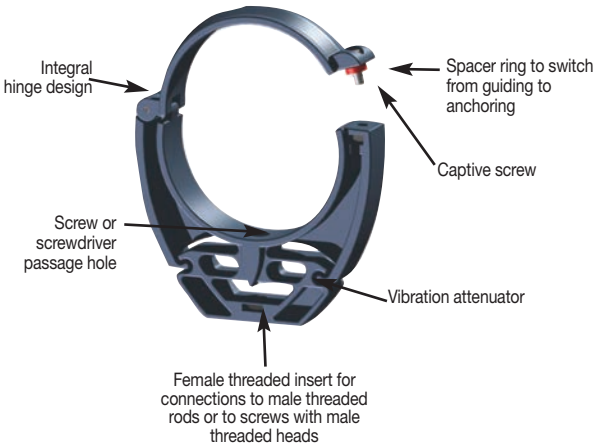
Anchors and guides allow for the expansion movements of a piping network to take place without damaging the pipes. PHONOKLIP® brackets were specially designed for drainage piping networks and can be used for both anchoring and guiding functions.

For anchoring purposes, remove the red spacer ring before closing the bracket.

For guiding purposes, keep the red spacer ring in position so that the pipe is allowed to move freely.

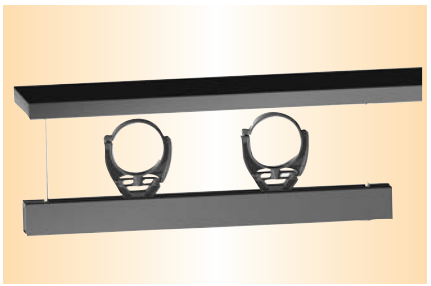
The essential function of a bracket is to keep the piping networks in position, even when submitted to heavy loads. PHONOKLIP® brackets were designed to obtain:

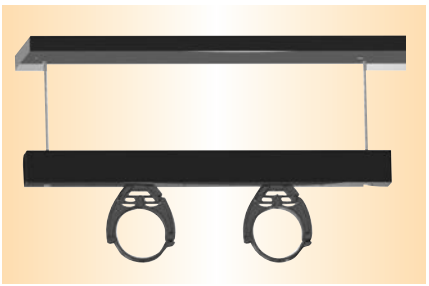
- The best possible acoustic performances: 11 dB(A) structural noise measured by Fraunhofer Institut, Germany (flow rate 2 l/s according to EN 14366 standard).
- The mechanical performances required to ensure its supporting function during its entire lifetime.



■ INSTALLATION CONFIGURATIONS

Thanks to its design, PHONOKLIP® brackets can indifferently be installed with horizontal or vertical piping networks.

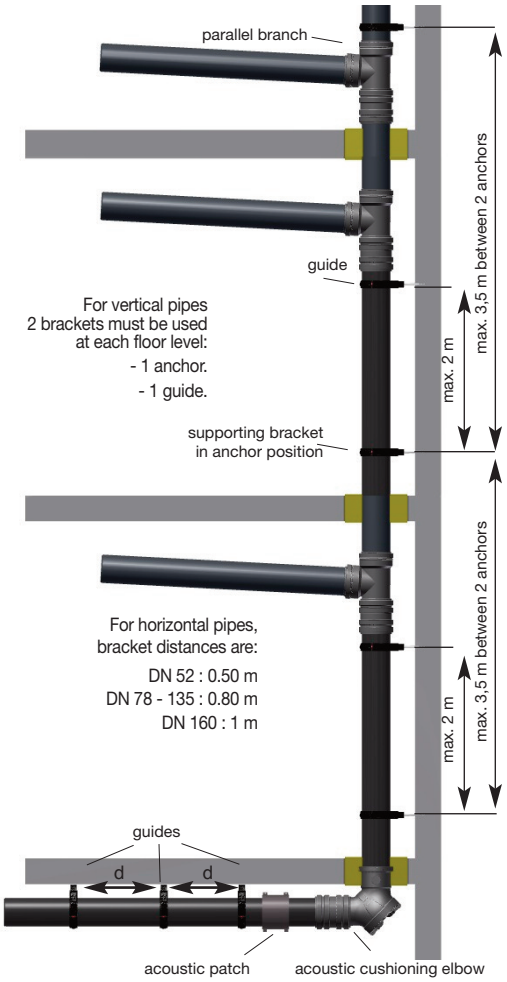




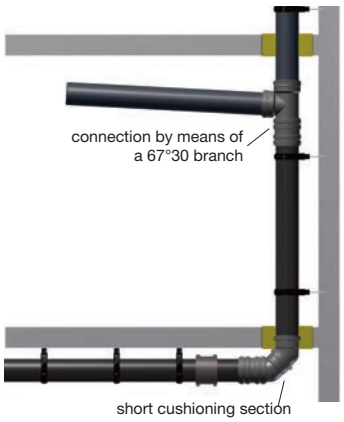
FRIAPHON® INSTALLATION
Installation of horizontal and vertical piping sections

■ DISTANCES BETWEEN PHONOKLIP® BRACKETS

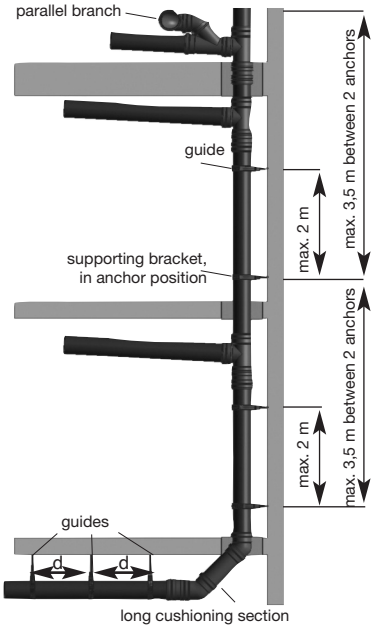
GIRPI recommended configuration



Alternative configuration for pipe drops up to 10 m

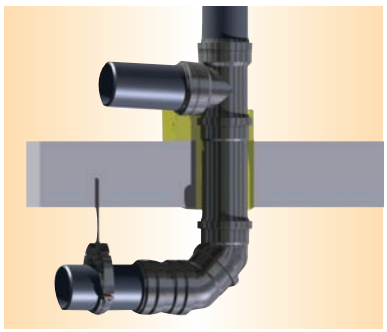


Alternative configuration for pipe drops above 10m

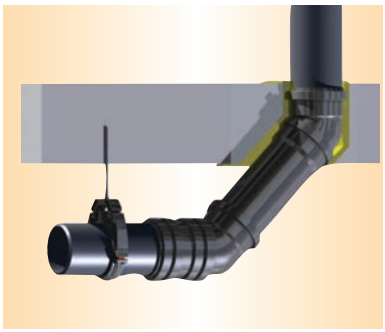


Note: when using rubber lined metal brackets (such as SCA and SCB), refer to technical sheet 7.11 (p.42).

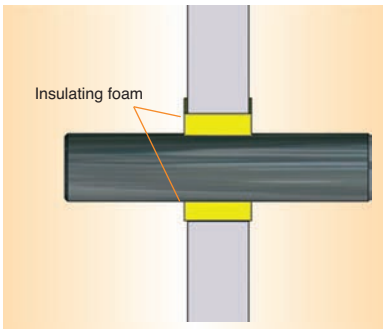
■ ACOUSTIC INSULATION OF PIPES PASSING THROUGH FLOORS, PARTITIONS AND WALLS



Passage through floor
with short cushioning section
(up to 10m pipe drop)



Passage through floor
with long cushioning section
(above 10m pipe drop)



Passage through wall or partition

In order to limit the transmission of structural noises, pipes must be disconnected from floors, partitions and walls each time they pass through, by use of foam or insulating material (minimum thickness 4mm).

FRIAPHON® INSTALLATION
Special recommendations

■ CONNECTIONS BETWEEN FRIAPHON® AND OTHER EXISTING PIPING SECTIONS

GIRPI recommended configurations, using GIRPI's FRIAPHON® and PVC metric solvent welded drainage or pressure articles for optimal modularity and compatibility.

FRIAPHON® INSTALLATION
Special recommendations

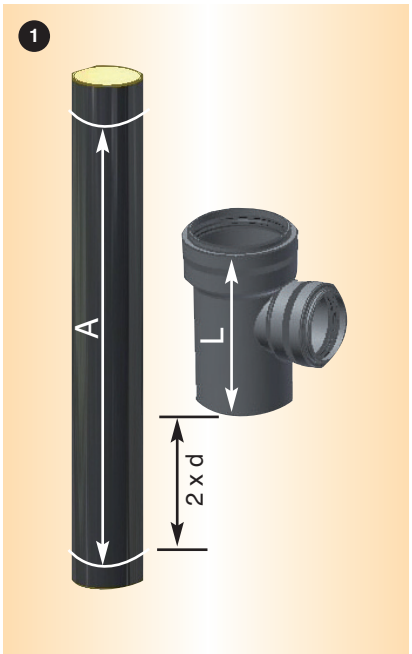
SPECIAL INSTALLATIONS

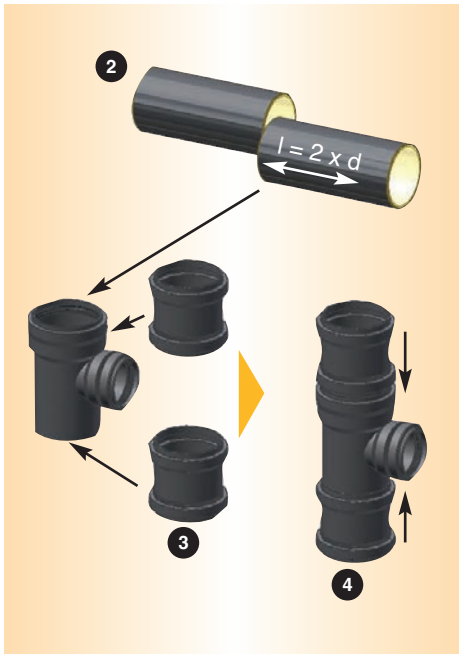
Only solvent welded joints are accepted for installations built in, embedded in or hidden behind inaccessible walls or floors.
FRIAPHON® pipes passing through floors, partitions or walls must be protected from shearing by a sleeve allowing them to move freely (e.g. by using a larger diameter PVC pipe).

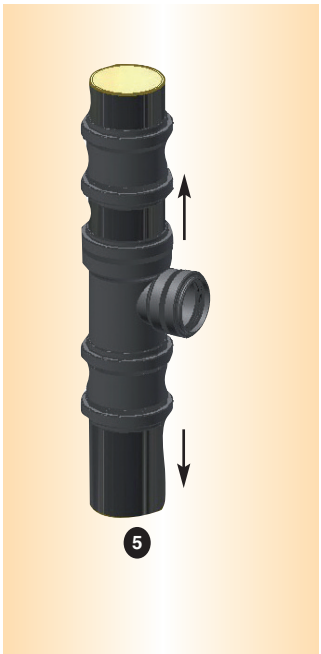
SPECIAL FABRICATED ITEMS

GIRPI can fabricate special items upon request, in order to adapt the installation to particular situations or special configurations. In France, those fabricated articles are not covered by the ATEC certificate and shall be used under the contractor's responsibility.
Price and delivery can be obtained from GIRPI's technical support team: **be.girpi@aliaxis.com** or **+33 (0)2 32 79 58 00**

INSTALLATION OF ADDITIONAL BRANCHES







1. Cut pipe to length using the following formula:
   A = L + 2 x d

2. Cut an adaptor nipple from the cut pipe to length:
   l = 2 x d
   Chamfer nipple at both ends.

3. Insert the chamfered nipple into the socket end of the branch.

4. Insert repair sleeves at each end of the branch.

5. Connect repair sleeves with existing piping network.

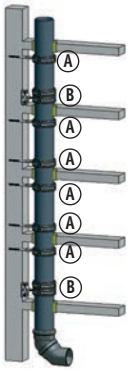
200	200	M10	145	**SCA200**

ANTI-VIBRATION SUPPORTING BRACKETS (Type B)

DN	Reference
70	**SCB78**
100	**SCB110**
125	**SCB135**
150	**SCB160**
200	**SCB200**



1 USE OF SCA "TYPE" A AND SCB "BRACKETS"

- Vertical run: use one "type B" bracket at 3 floor intervals, and use "type A" brackets in between.
- Horizontal run: use "type A" brackets only, separated by a maximum distance equal to 10 times the pipe's diameter (e.g. by a maximum distance of 1100 mm for ø110 mm pipe).

PHONOKLIP® BRACKETS WITH 7 x 150, M8, M10 THREADED INSERTS

ANCILLARY EQUIPMENT
Fire collars

■ FIRE SAFETY:

FRIAPHON®'s fire reaction rating is B s1 d0 according to Euroclasses (EN 13501). Its material composition and its design also enabled it to obtain an NF-Me certification for diameters ranging from 78 to 160 mm. That NF-Me certification implies that the fire resistance performances of FRIAPHON® on its own correspond to the E30 fire resistance class (i.e. FRIAPHON® can provide a 30 minute passive fire protection through partitions).

In France, FRIAPHON®'s performances enable it to meet the requirements of fire regulations in buildings receiving the public (E.R.P.) in most configurations (pipes passing through floors, walls and more generally all partitions, coming from or leading to low or average risk areas, whether accessible to the public or not).

When higher fire resistance classes are required (up to 120 minutes - EI 120 U/U), specific fire collars or equivalent devices must be used.

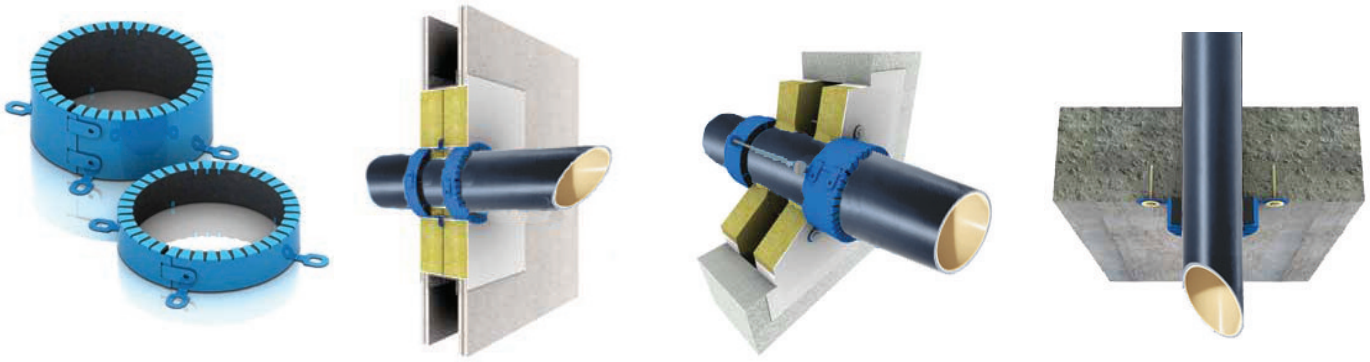
A test report according to EN 1366-3 standard, covering the pipe / fire collar combination, must be provided in order to demonstrate its performances.

GIRPI recommends the use of PROMASTOP® FC6 fire collars, which enable FRIAPHON® to obtain such higher performance requirements when passing through floors, walls or partitions (such as light plasterboard partitions with or without mineral wool, or concrete floors and walls).

The table below indicates which PROMASTOP PC6 reference must be used according to various FRIAPHON® pipe diameters (OD = outside diameter, ID = inside diameter):

Reference	FRIAPHON® pipe OD mm	Pipe OD mm	Collar ID mm	Collar OD mm	Hole centres mm	Anchoring depth mm
FC6/63	52	56	64	81	90	60
FC6/90	78	90	100	120	130	60
FC6/90	90	90	100	120	130	60
FC6/110	110	110	120	142	150	60
FC6/140	135	140	150	180	190	60
FC6/160	160	160	170	200	210	60
FC6/200	200	200	210	240	250	60

GIRPI recommends following the manufacturer's installation guidance for PROMASTOP® FC6 fire collars, which can be downloaded at: **www.promat-see.com/en/downloads**



- **Rigid floor,** thickness 150 mm, minimum density 650 kg/m³, made from concrete.
- **Light partition,** thickness 100 mm, plasterboard 2 x 12.5 mm on each side, fixed on 50 x 50 mm metal rails, with mineral wool insulation between the boards.

Test reports are available upon request from GIRPI's technical support team at

SPECIFICATION
ACOUSTIC DRAINAGE

ESA5 acoustic piping system for the drainage networks of soil, waste and rain water effluents inside buildings, from diameter 52 mm to diameter 200 mm.

IDENTIFICATION - RANGE:

The complete system shall be designed for its global acoustic performance. Pipes, fittings and brackets shall come from one same supplier.

Pipes shall be made of two coextruded layers of PVC with increased density, in order to reduce the transmission of sound waves. Those pipes shall be available in 3m lengths, or 2.6m lengths for standard floor heights. The pipes' internal layer shall be of beige colour. The fittings and the pipe's external layer shall be of dark grey colour.

The system shall include:

• double sockets with three gaskets each, absorbing expansion movements and completely disconnecting pipes from each other, to prevent noise transmission,

• a large range of fittings ensuring homogeneous acoustic performances and adaptation to all configurations on building sites (horizontal and vertical).

• cushioning elbows and acoustic patches attenuating impact noises at the bottom of pipe stacks and under toilets.

• brackets made from one single material with an integrated vibration attenuation system to limit structural noises.

QUALITY - CERTIFICATIONS:

The piping system shall bear the marks corresponding to its quality certificates and all information elements to make its production traceable.

• The system shall come from a company certified according to ISO 9001, ISO 14001, OHSAS 18001.

• The system's pipes and fittings shall be certified under ATEC by CSTB in diameters ranging from 52 mm to 160mm, and shall also have a CSTBat certification.

• The system shall be B s1 d0 rated under Euroclasses according to EN 13501-1 standard, and shall be NF-Me rated.

ACOUSTIC PERFORMANCES:

The manufacturer shall be able to provide acoustic test reports carried out by independent laboratories by approved European organisations, proving that the system significantly reduces noise emissions caused by the flow of effluents, i.e.: an ESA5 rating for straight downpipes, and good acoustic performances at deflection points, in both horizontal and vertical positions.

TECHNICAL SUPPORT:

The manufacturer shall be able to:

- propose its BIM product library,
- produce drawings to help the implementation of its product, based upon the drawings and dimensioning data supplied by the appointed contractor,
- propose professional training sessions on the building site or on its own premises, to help with the implementation of its product.

ENVIRONMENT:

The system shall be covered by an Environmental and Sanitary Data Sheet (FDES) according to NF-EN 15804+A1, and its national appendix XP P01-064CN in France. That document shall have been validated by an independent organisation.

The system shall be recyclable through an existing recovery network.

More SERVICES from GIRPI...

NETWORK DESIGN AND TECHNICAL ASSISTANCE

Our technical assistance and design service can help optimize network drawings

- Drawings featuring all GIRPI articles.
- Complete bill of materials.
- Calculations of bracketing,...

Contact : be.girpi@aliaxis.com

HOTLINE 33 (0)2 32 79 58 00

Our hotline is at your disposal to answer your questions and help you successfully install our products on your building projects.

TRAINING

Our training center (officially recognized for vocational training) gives installers and decision-makers modular training courses about installation techniques.

CUSTOM-MADE ITEMS

Our fabrication workshop can manufacture your special items as per your requirements and can also prefabricate pipework sections.

Please consult us for prices and deliveries.
